

Cell Types

...from so simple a beginning endless forms most beautiful and most wonderful have been, and are being, evolved.— Charles Darwin

**Prokaryotic Cells
(and viruses)**

Terminology

- Prokaryotic Cell:
 - Pro karyote = “before” “nucleus”

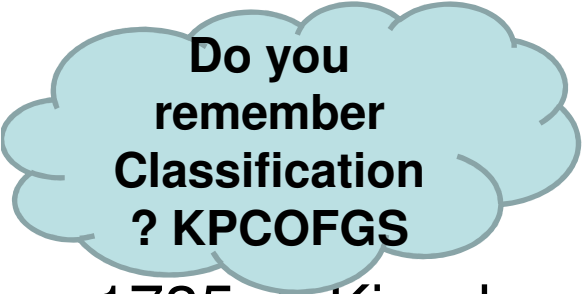

- Bacteria & Archaea

- Eukaryotic:
 - Eu karyote = “true” “nucleus”

- Plantae, Animalia, Fungi, Protista

The Evolving Understanding of Living Things

Do you
remember
Classification
? KPCOFGS

- 1735- 2 Kingdoms: Animalia & Vegetalia
- 1866- 3 Kingdoms: Animalia, Plantae, Protista
- 1925- 2 Kingdoms: Eukaryote, Prokaryote
- 1938- 4 Kingdoms: Animalia, Plantae, Protista, Monera
- 1940+- 5 Kingdoms: Animalia, Plantae, Fungi, Protista, Monera
- 1990's- 6 Kingdoms: Animalia, Plantae, Fungi, Protista, Eubacteria, Archaeobacteria
- Current-
 - **3 Domains: Archaea, Eubacteria, Eukaryote**
 - 4 Eukaryote Kingdoms: Animalia, Plantae, Fungi, Protista ??
(Of course THIS too is debated)

Archaea are Prokaryotes, but NOT bacteria

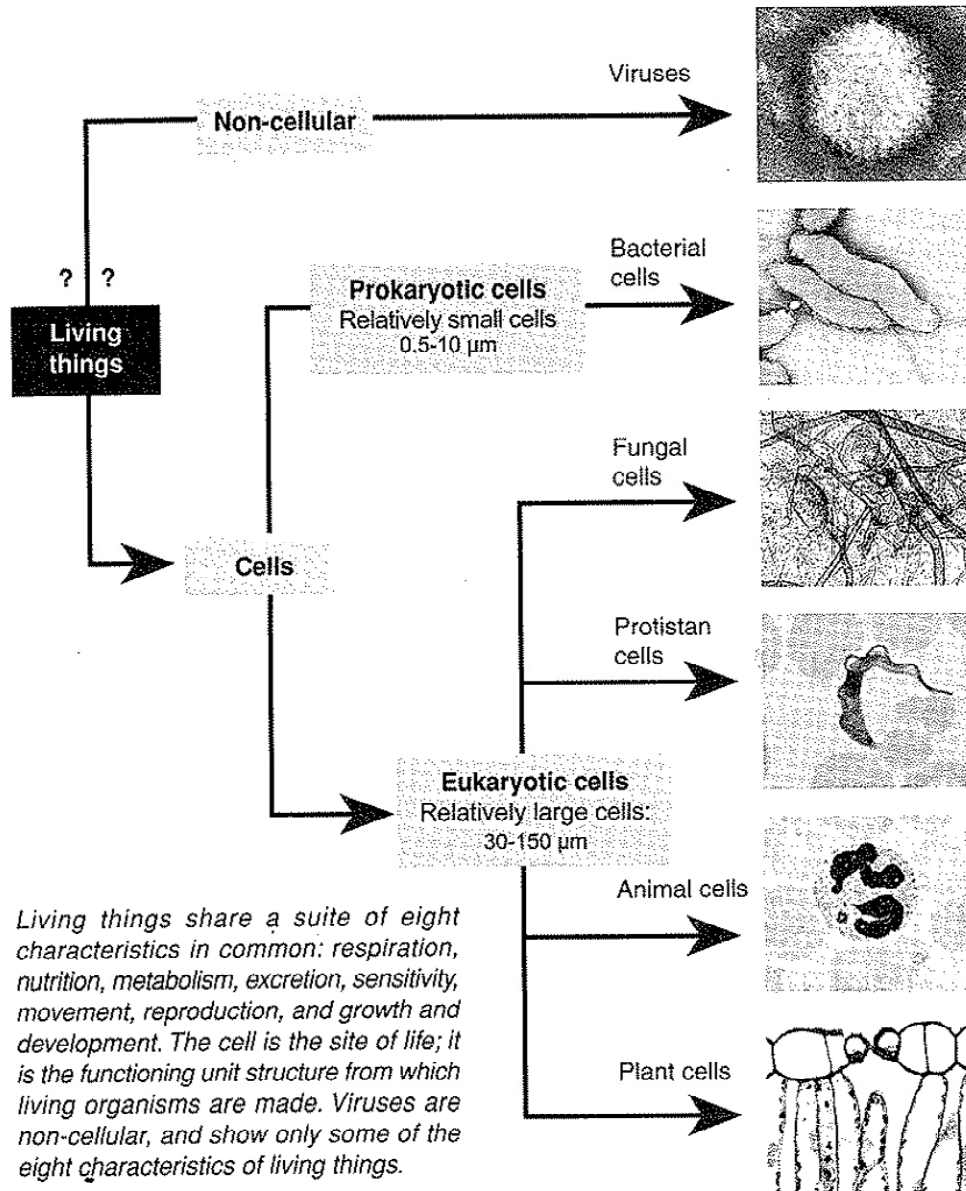

Why do we know this?

- Evolutionary Biology
- Genetic Research

A new level of classification (Domain) above Kingdom was required to make our model fit our observations.

TOK: Classification as an invention

Types of Living Things

Viruses

- Non-cellular. Typical size range: 20-300 nm.
- Contain no cytoplasm or organelles.
- No chromosome, just RNA or DNA strands.
- Covered in protein coat.
- Depend on cells for metabolism and reproduction.

Bacterial cells

- Single-celled. Typical size range: 2-8 µm length.
- Lack a distinct nucleus. DNA usually a single, naked chromosome, sometimes also with plasmid DNA.
- Have no membrane-bound organelles.
- Cell walls of peptidoglycan. Many secrete a capsule.

Fungal cells

- Rarely discrete cells.
- Possess nucleus and membrane-bound organelles.
- Plant-like but lack chlorophyll.
- Rigid cell walls that contain chitin.
- Heterotrophic.

Protistan cells

- Mainly single-celled or exist as cell colonies.
- Possess nucleus and membrane-bound organelles.
- Some are photosynthetic autotrophs.
- Some are heterotrophic.

Animal cells

- Exist as part of multicellular organism with specialization of cells into many types.
- Possess nucleus and membrane-bound organelles.
- Lack cell walls. Exhibit many cell types.
- Heterotrophic.

Plant cells

- Exist as part of multicellular organism with specialization of cells into many types.
- Possess nucleus and membrane-bound organelles.
- Autotrophic: photosynthetic cells have chloroplasts.
- Cell walls of cellulose.

Prokaryotic Cells

Prokaryotes are smaller than eukaryotes and came first in terms of evolution.

'before'
'nucleus'

This scanning electron micrograph (SEM) shows E. coli, a common type of bacteria.

1 μm

Types of Prokaryotic Cells

- Archaea

- Eubacteria

Prokaryotic Cell Structure

The ultrastructure of *E. coli* as an example of a prokaryote

<http://www.cbs.dtu.dk/staff/dave/roanoke/genetics980325f.html>

E. coli is the classic 'model' microbe, used in many kinds of pathogenic and genetic research.

Prokaryotic cell parts are not generally membrane-bound, so we don't refer to them as organelles.

What are the functions of these prokaryotic cell parts?

Remember, these cell parts are not membrane-bound as in a eukaryote, so we don't call them organelles.

Movement

Protein synthesis

Attachment, DNA transfer

Protective coating, can be Gram-positive or Gram-negative

Contains enzymes for metabolism

Region containing closed-loop DNA

Controls entry and exit of substances

What are the functions of these prokaryotic cell parts?

Remember, these cell parts are not membrane-bound as in a eukaryote, so we don't call them organelles.

Movement **flagellum**

Protein synthesis **ribosomes**

Attachment, DNA transfer **pilli**

Protective coating, can be Gram-positive or Gram-negative **cell wall**

Contains enzymes for metabolism **cytoplasm**

Region containing closed-loop DNA **nucleoid**

Controls entry and exit of substances **plasma membrane**

**“Naked”
DNA!**

What's weird here?

Prokaryotic Cell Parts

mesosome

cell wall

plasma
membrane

pili

cytoplasm

nucleoid

ribosomes

flagella

Prokaryotic cell parts are not generally membrane-bound, so we don't refer to them as organelles.

Cell structures animation:

http://www.wiley.com/legacy/college/boyer/0470003790/animations/cell_structure/cell_structure.swf

Prokaryotic Cell Parts

Prokaryotic Cell Parts

mesosomes

These don't really exist naturally as bacterial cell parts, and could be an example of a **paradigm shift** in thinking.

They were observed in some electron micrographs and thought to be in-folds of membrane used for division, respiration or making cell walls...

... turns out they are an artifact of the preparation method for some electron microscope images.

Cell structures animation:

http://www.wiley.com/legacy/college/boyer/0470003790/animations/cell_structure/cell_structure.swf

<http://en.wikipedia.org/wiki/Mesosome>

Identifying Prokaryotic Structures in an Electron Micrograph

Which structures can you identify in this electron micrograph?

<http://fig.cox.miami.edu/~cmallery/150/proceuc/c7x4prokaryote.jpg>

Which structures can you identify in this electron micrograph?

<http://fig.cox.miami.edu/~cmallery/150/proceuc/c7x4prokaryote.jpg>

Past-paper question: *E. coli* TEM image

Identify these structures:

- I.
- II.
- III.
- IV.

Calculate the magnification of the image.

Past-paper question: *E. coli* TEM image

Identify these structures:

- I. Plasma membrane
- II. Cell wall / pili
- III. Nucleoid
- IV. Cytoplasm / ribosomes

Calculate the magnification of the image.

1. Measure the scale bar in mm.
 2. Multiply $\times 1000$ to convert to μm .
- That is the magnification.

How long is the bacterium?

Plasmids

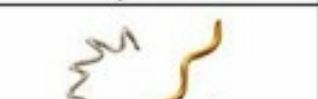

Bacterial Shapes

Kathleen Park Talaro and Arthur Talaro, *Foundations in Microbiology*, 3e Copyright © 1999 The McGraw-Hill Companies, Inc. All rights reserved.

Bacterial shapes and arrangements

 Coccus		 Rod, or Bacillus		 Curved forms: Spirillum/Spirochete
 Diplococci (cocci in pairs)	 Neisseriae (coffee-bean shape in pairs)	 Coccobacilli		 Vibrios (curved rods)
 Tetrads (cocci in packets of 4)	 Sarcinae (cocci in packets of 8, 16, 32 cells)	 Mycobacteria	 Corynebacteria (palisades arrangement)	 Spirilla
 Streptococci (cocci in chains)	 Micrococci and staphylococci (large cocci in irregular clusters)	 Spore-forming rods	 Streptomycetes (moldlike, filamentous bacteria)	 Spirochetes

Pathogenic and Probiotic Bacteria Lab

- There is bacteria in yogurt?!

Total Carbohydrate		300g	375g
Dietary Fiber		25g	30g
Protein		50g	65g

INGREDIENTS: CULTURED GRADE A NON FAT MILK, SUGAR, STRAWBERRIES, WATER, CONTAINS LESS THAN 1% OF MODIFIED CORN STARCH, PECTIN, NATURAL FLAVOR, FRUIT JUICE AND VEGETABLE JUICE (FOR COLOR), CARRAGEENAN, SODIUM CITRATE, CALCIUM CITRATE, LACTIC ACID.

CONTAINS THE ACTIVE CULTURES *L.BULGARICUS*, *S.THERMOPHILUS* AND *BIFIDOBACTERIUM LACTIS* DN 173-010 (*Bifidus Regularis*®)

What about antibiotics?

Prokaryotic Reproduction

Prokaryotes reproduce by binary fission:
'two' 'splitting'

(This is much simpler than mitosis in eukaryotes)

<http://www.youtube.com/watch?v=FcjAsTTN8qU>

Prokaryotes divide by **binary fission**.

Genetic Transfer via Bacterial Conjugation

- Sex Pilus
- Plasmid

Because it's good to know: *What's gram-staining?*

Bacteria can be classified as either **gram-positive** or **gram-negative**. This refers to their ability to hold a purple stain and is used in culture to identify disease-causing bacteria.

Gram positive

Gram negative

Function / Uses of Prokaryotic Cells

- In humans
 - Digestion- symbiotic relationship/up to 60% of fecal dry mass/ helps digest food we cannot alone / probiotics
 - Skin- might help prevent excessive inflammation like psoriasis/withstands acidic environment and prevents pathogenic bacteria from growing
 - The human microbiome (Thanks to A.V.W.)
<http://www.economist.com/node/21560523>
 - Probiotics & gut bacteria transplants
- In environment (Food Inc.)
 - Angler Fish
 - Cattle Digestion <http://www.youtube.com/watch?v=NkhdGG5pVW8>
- In food
 - Buttermilk, Cheese, Yogurt
 - Bacteria in Food <http://www.youtube.com/watch?v=6FPy5m1-BQI>
- Other Uses
 - Transgenic Bacteria

Overview of Bacterial infections

Bacterial meningitis

- *Streptococcus pneumoniae*
- *Neisseria meningitidis*
- *Haemophilus influenzae*
- *Streptococcus agalactiae*
- *Listeria monocytogenes*

Otitis media

- *Streptococcus pneumoniae*

Pneumonia

Community-acquired:

- *Streptococcus pneumoniae*
- *Haemophilus influenzae*
- *Staphylococcus aureus*

Atypical:

- *Mycoplasma pneumoniae*
- *Chlamydia pneumoniae*
- *Legionella pneumophila*

Tuberculosis

- *Mycobacterium tuberculosis*

Skin infections

- *Staphylococcus aureus*
- *Streptococcus pyogenes*
- *Pseudomonas aeruginosa*

Sexually transmitted diseases

- *Chlamydia trachomatis*
- *Neisseria gonorrhoeae*
- *Treponema pallidum*
- *Ureaplasma urealyticum*
- *Haemophilus ducreyi*

Eye infections

- *Staphylococcus aureus*
- *Neisseria gonorrhoeae*
- *Chlamydia trachomatis*

Sinusitis

- *Streptococcus pneumoniae*
- *Haemophilus influenzae*

Upper respiratory tract infection

- *Streptococcus pyogenes*
- *Haemophilus influenzae*

Gastritis

- *Helicobacter pylori*

Food poisoning

- *Campylobacter jejuni*
- *Salmonella*
- *Shigella*
- *Clostridium*
- *Staphylococcus aureus*
- *Escherichia coli*

Urinary tract infections

- *Escherichia coli*
- Other *Enterobacteriaceae*
- *Staphylococcus saprophyticus*
- *Pseudomonas aeruginosa*

Viruses

What is a virus?

- A virus is a small infectious agent that can replicate only inside the living cells of organisms.
- Most viruses are too small to be seen directly with a light microscope.
- Viruses infect all types of organisms, from animals and plants to bacteria and archaea.
- About 5,000 viruses have been described in detail, although there are millions of different types
- Viruses are found in almost every ecosystem on Earth and are the most abundant type of biological entity.
- The study of viruses is known as virology, a sub-speciality of microbiology.
- We consider viruses to be
NON LIVING

- SEM image of HIV

Viral Components

- Virus particles (known as *virions*) consist of two or three parts: the genetic material made from either DNA or RNA, long molecules that carry genetic information; a protein coat that protects these genes; and in some cases an envelope of lipids that surrounds the protein coat when they are outside a cell.

Shapes / Forms?

- The shapes of viruses range from simple helical and icosahedral forms to more complex structures.
- The average virus is about one one-hundredth the size of the average bacterium.
 - Which is...?

Icosahedral Adenovirus

Herpes Virus with lipid envelope

Discovering Viruses

- Dmitri Ivanovsky: 1892 article describing a non-bacterial pathogen infecting tobacco
- Martinus Beijerinck: 1898 discovery of the Tobacco Mosaic Virus

Viral Replication
